Project Scope

The objective of this project is to develop a relational database system to replace the current manual “Lab Tracker” spreadsheet. The goal is to centralize the management of courses, sections, and student course performance data.

- Hierarchy from the top will break down, starting from Sections to associated Lab sessions.
- Tracking student performance:
    - Attendance status and completion indicators
    - Submission timestamps with update feedbacks
    - Grade recording
- The marks inputted will show feedback on who did the last edits (TA vs. Instructor)
- A changelog to track modifications and to be able to identify the specific staff member.
- A record of a cell’s previous value and the new value.

Business Rules

- All attributes in the lab progress cannot be null by the deadline. If a grade is null by submission, it automatically turns into a 0.
- The students' lab progress score must be in the range of 0 to 100.
- Each student has one lab progress entry per lab.
- Each lab must have an instructor or a TA during meeting time.
- Each lab has the same meeting time and location during a single semester.
- Each lab and student must have a section showing their current term.
- Staff must be either an instructor or a TA.
- All attributes in the change log must be connected to a staff member.
- A lab cannot exist without being assigned to a specific section.
- A “Lab Progress” record is uniquely identified by the combination of a StudentID and LabID to ensure students cannot have duplicate records for the same lab.
